Cotton Varieties Planted, United States 1971-1975

Stoneville and Deltapine were the leading varieties of cotton planted in the United States in the 1975-76 season according to the Department of Agriculture, Agricultural Marketing Service. Each of these varieties accounted for nearly one-fifth of this year's acreage. Iankart was the third leading variety, being planted on about one-sixth of the acreage. The other major varieties, Acala, Paymaster and Coker together accounted for about one-fourth of the acres planted this year.

Stoneville became the leading variety of cotton planted in the United States this year by a small margin. Nineteen percent of the 1975 cotton acreage was planted to Stoneville compared with 18 percent a year earlier. Stoneville was the major variety planted in Alabama, Arkansas, Missouri and Tennessee and also accounted for a substantial proportion of the planted acreages in Louisiana and Mississippi. Stoneville 213, the principal Stoneville strain, represented 17 percent of the total cotton acreage.

Deltapine dropped into second place among the leading varieties after being the most popular variety for six straight years. The acreage planted to Deltapine in 1975 was estimated at 18 percent, down from 22 percent a year earlier. Deltapine was the most popular variety in Arizona, Louisiana and Mississippi and was the second most popular variety in Arkansas, Missouri and Tennessee. Deltapine 16, the predominating Deltapine strain, comprised 14 percent of the total acreage planted in the United States.

Lankart was the third leading variety planted this year and accounted for 14 percent of the total acreage. This is up from the 11 percent planted a year earlier and is the largest percentage planted to this variety since 1967. Lankart, the leading variety in the Southwest, accounted for nearly one-fourth of the acreage planted in Texas and over three-fourths of the acreage in Oklahoma.

Acala, the fourth leading variety, represented ten percent of the total acreage planted in 1975 compared with 15 percent planted last year. Acala was the principal variety planted in California and New Mexico.

Paymaster was the fifth leading variety planted this year. This variety accounted for eight percent of the 1975 planted acreage compared with six percent in 1974. Paymaster continued to be the second most popular variety in Texas where it accounted for nearly a fifth of that state's total acreage.

The sixth leading variety planted this year was Coker, which represented six percent of the total acreage. This is down slightly from a year earlier and is the smallest proportion planted to Coker since 1969. Coker remained the number one choice of farmers in Georgia, North Carolina and South Carolina.

Pima S-4 was the leading strain of American Pima cotton planted in 1975, accounting for 75 percent of the total Pima acreage. This compares with 93 percent a year earlier and 87 percent two years ago.

Estimates of the percentages of the various varieties of cotton planted in the United States in 1975, by counties, Smith-Doxey cotton classing office territories and states are presented in this report. Comparative variety data for the four years 1971-1974 are shown by states. The variety data are based primarily on estimates furnished by cotton ginners for the territories served by their gins.

Estimated percentage of cotton acreage planted to specified varieties, United States, 1971-1975

^{1/} Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1974", USDA, AMS, Cotton Division, May 1975.

^{2/} Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.

^{3/} Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. Zero gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using Stelometer and results are adjusted to the Pressley level.

Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
